DEC integrated fleet & dispatch requirements

DEC | Combined specification v1.4 - Public copy
28 October 2026 | For developer quotation and acceptance

One platform, shared records

Deliver one office platform with connected booking/dispatch, fleet/maintenance, workforce/compliance, school transport and finance modules. Use one authoritative driver, PA and vehicle record across modules. Drivers must access dispatch and fleet workflows through the agreed iOS and Android staff app; PA screens are role-based. Customer booking access remains a separate customer interface.

New DEC instructions incorporated

• Minor-defect review, practical garage advice, bookings and follow-up.

• A live office map of drivers while on duty, with clear connection and location freshness indicators.

• Driver-app buttons for Arrived, POB (Passenger On Board) and Job Clear.

• A dedicated PA details page with equivalent relevant staff records, document requirements, training, reminders and eligibility checks.

How this combined document is organised

Section	Content
Part A - 6 pages	Integration rules, new requirements and acceptance tests.
Part B - 20 pages	Full uploaded Fleet & Workforce Management requirements v1.5, retaining all original IDs and AT-01 to AT-24.
Part C - 8 pages	Full DEC Dispatch System requirements v1.0, including supplier response and dispatch acceptance demonstrations.

Part D at the end adds the four app references, recommended modules and quality tests. All baseline requirements remain in scope, including specialist-module conditions. Parts B and C retain their original numbering; use PDF bookmarks for navigation. Public references are not proof of private-app feature parity.

Integration and precedence rules - INT-NEW-01

Apply the more specific fleet v1.5 controls where wording overlaps: unlimited sub-companies without a software cap or per-company licence charges; one-calendar-month fleet reminders; DEC ownership of custom source and independent rebuild; and protected personnel records. These additions extend dispatch functions and must not weaken safety gates. A recovery target suited to live dispatch must be agreed, priced and tested before contract. The earlier fleet-only USD 2,000 / 22-day quotation is not a quotation for this combined scope.

DEVELOPER CONTACT - PUBLISHING PLATFORM ONLY

Please contact DEC only through the messaging or proposal system on the platform where this requirement is published. Do not seek or use company telephone numbers, email, WhatsApp, social media or website contact forms. Submit questions and quotations through the publishing platform only.

Minor defects and garage advice

DEF-NEW-01 to DEF-NEW-06 | Extend the existing DEF and SRV workflows

DEF-NEW-01 | Report and classify

Drivers/PAs report a defect against the vehicle with description, photos, time, mileage and current journey context. Permit a provisional minor category, but require an authorised competent reviewer to assess severity. Mark unassessed safety uncertainty as pending review; reporting staff must see clear escalation instructions.

DEF-NEW-02 | Recorded advice and operating decision

The reviewer records one of: stop use / urgent inspection; garage visit before next duty; book by a stated date or mileage; or monitor with a recheck. Record the reason, reviewer, time, any restrictions and evidence. The app must show whether use is permitted, pending or blocked. Minor defects are not automatically safe; software must not provide an automatic roadworthiness assurance from a photo or label.

DEF-NEW-03 | Advise staff to attend the garage

• Create a visible garage action for the assigned driver and office: garage name/address/contact, reason for visit, priority, appointment, deadline and responsible manager.

• Notify driver and manager, record acknowledgement, and escalate missed acknowledgements or appointments. Keep a call/manual escalation route when notifications fail.

• Allow staff to request clarification and upload inspection/repair results. Give the garage only the information needed for its assigned work.

DEF-NEW-04 | Link the visit to dispatch

Reserve vehicle downtime in the shared planner. Prevent dispatch into the garage period, including realistic travel time. Flag already assigned jobs for reassignment. A deadline/restriction must be visible to the controller and evaluated before new work; overdue action escalates for a fresh use decision. Safety-critical or legally invalid conditions remain blocked.

DEF-NEW-05 | Repair and follow-up

Link estimate, approval, parts, labour, invoice, warranty, photos and garage findings to the original defect. Show a traceable lifecycle: reported > reviewed > advised/booked > inspected/repaired > verified > closed, or monitored with a next review. Apply the existing independent verification and server release requirements for safety defects. A garage appointment alone does not clear the defect.

DEF-NEW-06 | Staff and management visibility

Provide Minor defects / Garage actions views with open, monitored, booked, overdue and resolved filters. Drivers see vehicle-specific instructions and acknowledge them. Managers see defect age, garage deadlines, downtime and cost. Keep original entries and all correction/decision history.

Live map and driver job buttons

MAP-NEW-01 to 04 and JOB-NEW-01 to 05 | Office dashboard and staff apps

MAP-NEW-01 | On-duty live map

Show authorised controllers a live map of on-duty drivers, assigned vehicle, company, job status and current/next job. Filter by company, vehicle category and availability. Support driver search, ETA to pickup, traffic-aware routing where provided, and controller drill-down. Off-duty drivers must not appear as currently working or continue staff-app tracking outside the agreed disclosed policy.

MAP-NEW-02 | Freshness and background operation

Display last location time, GPS accuracy where available, connection state and stale/offline warnings. Proposed target: location updates every 10-15 seconds while on duty with usable GPS/data, and a stale warning after 60 seconds without an update; final targets must be agreed and tested for battery use and platform limits. Never present an old location as live. Verify Android/iPhone background, locked-screen, permission-denied and battery-saving behaviour.

MAP-NEW-03/04 | Access and operational fallback

Enforce company permissions on map views, APIs, history and exports. Keep tracking retention/access purpose-specific and disclosed. A failed feed alerts the office; the app explains missing permission or connection. Customer tracking is limited to its own authorised booking and expires. School tracking must not reveal other pupils' details or home locations.

JOB-NEW-01 | Required workflow

Driver button / state	Required behaviour
Accept / En route	Accept the assigned job, then mark travel to pickup; show these states on the office board.
Arrived	Means driver arrived at pickup. Timestamp it and update the controller; send an arrival message if configured.
POB	Means Passenger On Board. Record actual pickup/start time; show passenger onboard on the map and booking board.
Job Clear	Means passengers dropped off and the journey completed. Record completion, destination and permitted fare/extras; update the office.

JOB-NEW-02/03 | Safe transitions and exceptions

Prevent accidental completion with confirmation and enforce the normal sequence. Handle no-show, cancellation, reassignment, incorrect taps and emergency termination separately, with permission, reasons and preserved history. Passenger delay is not the Arrived state. Customer payment status remains separate from journey completion; Job Clear must not falsely mark an unpaid job paid.

JOB-NEW-04/05 | Reconnection and availability

Queue offline status changes with original event times and distinct server-receipt times; show pending sync and reject duplicates/conflicts safely. The office must not imply receipt before sync. After Job Clear, set available only if the driver remains on duty, vehicle/staff are cleared and no break or school sweep is pending. School runs must complete required end-of-run checks before availability is restored.

Dedicated PA details page

PA-NEW-01 to PA-NEW-06 | Extend PEO, TRN, DBS and APP requirements

PA-NEW-01 | Separate PA directory and profile

Provide an office menu/page for Passenger Assistants, with search, company/depot filters, active/inactive status and individual profiles. Include the same relevant personnel fields, document handling, reminders and audit controls as driver records. A PA who also drives has linked roles on one person record; do not duplicate identity or demand driving credentials for PA-only work.

Profile tab	Required fields and workflows
Personal / employment	Staff ID, name/photo, contact and address, emergency contact, company/depot, start/end dates, employment/contract status and approved duties. Restrict sensitive identity and right-to-work evidence.
Documents / vetting	PA ID/authorisation, relevant council or contract approval, restricted DBS metadata/status, permission/review information and necessary supporting evidence. Record source, reviewer and review date.
Training / competence	Safeguarding, PA/PAT, first aid, disability awareness, wheelchair lift/restraint assistance and other role-specific courses. Store provider, attendance, result, certificate, review/expiry where specified and verifier. MiDAS applies where relevant to approved duties.
Availability / assignments	Shifts, leave, absence, current/future routes, paired driver/vehicle, working company, schedule conflicts and assignment history. Support more than one PA on a route.
Operational clearance	Cleared, pending or restricted by company, contract and duty; missing requirements, next reviews and blocked allocation reasons.
App / acknowledgements	Own duties, permitted support instructions, reminders, policy acknowledgement, attendance/handover actions, incident reporting and required school sweep/countersignature.
History / reporting	Versions, authorised edits, expiry/review reminders, training/clearance reports and permission-controlled export.

PA-NEW-02/03 | Requirement templates and reminders

Managers configure mandatory document/training sets by PA role, council and school contract. Store verified completion and review evidence; send reminders and show missing requirements. DBS review is distinct from a universal expiry date. Preserve the fleet v1.5 restrictions on DBS records and authorised checking.

PA-NEW-04 to 06 | Permissions, allocation and offboarding

Controllers see operational clearance and necessary duty information; vetting/medical/safeguarding detail remains separately restricted. Route allocation validates every assigned PA as well as the driver and vehicle. PA-only users can complete their supported app workflows without a driving licence. Offboarding revokes access and future assignments, ends unnecessary checks and follows the approved retention policy.

Combined acceptance and delivery

AT-C01 to AT-C10 | Additional tests; retain all baseline acceptance tests

Test	Required demonstration
AT-C01	Report a provisional minor defect; reviewer records garage advice and a use decision. Driver sees instructions and acknowledgement is recorded.
AT-C02	Book a garage visit; vehicle downtime conflicts with an existing journey. Controller is alerted and new overlapping allocation is blocked.
AT-C03	Escalate an overdue minor-defect action. Reclassify to critical, block allocation and verify the existing authorised repair/release gate.
AT-C04	On Android and iPhone, show on-duty locations and statuses on the permitted company map. Test background/locked-screen operation, loss of GPS/data and stale-location warnings.
AT-C05	End duty and confirm staff-app work tracking stops under the agreed policy. Cross-company and customer links cannot expose unauthorised locations or history.
AT-C06	Accept a job, mark En route, Arrived, POB and Job Clear. Office states/timestamps match; notifications follow configuration; unpaid remains unpaid.
AT-C07	Test accidental taps, no-show, cancellation and offline status syncing. Preserve original times, identify pending receipt and prevent duplicate completion or charges.
AT-C08	Create a PA-only profile with required records, training, documents and reminders; use the PA app without a driving licence. Driver/PA dual roles share one identity.
AT-C09	Assign a driver, vehicle and two PAs. One PA lacks a route requirement: block assignment. Controllers cannot access restricted DBS or safeguarding records.
AT-C10	Complete a school run: require the configured sweep/countersignature before making resources available. A continuing defect or invalid credential still blocks new work.

Supplier response and implementation

Respond to every new ID and all baseline IDs with the delivered solution, gap, dependency, cost, milestone and test evidence. Extend the shared data model and permission matrix; do not build separate driver/PA/vehicle copies for each module. Demonstrate a working vertical flow from defect report through dispatch blocking to verified release before pilot approval.

Commercial and release controls

Provide a fresh combined quotation and dependency-based schedule. Itemise mapping/GPS, messaging, licence providers, hosting, apps, backup/recovery and support costs. Agree live dispatch capacity, service targets, outage continuity and recovery before production. Payment milestones require accepted evidence; a screen mockup or deployed URL alone is not acceptance.

Baseline documents retained in full

Part B: Updated UK_Fleet_Management_Developer_Requirements_v1.5_DEC.pdf, supplied by DEC, 20 pages.
Part C: DEC_Dispatch_System_Requirements.pdf, v1.0, 8 pages.
This addendum records DEC's new instructions and proposed implementation/acceptance details. Source and legal references remain in the baseline documents; this consolidation does not independently recertify them.

Two years of 24/7 backend support

SUP-NEW-01 to SUP-NEW-06 | Mandatory DEC commercial requirement

SUP-NEW-01 | Term, coverage and price

Provide 24 months of backend support at no additional charge, available 24/7 including weekends and UK public holidays. Start on DEC written final production acceptance after the agreed pilot/tests. Pre-acceptance fixes remain part of delivery. Record the support start/end dates in the contract.

SUP-NEW-02 | Included backend responsibilities

• Support backend services, database, APIs, dispatch, compliance/reminder jobs and notification infrastructure within supplier responsibility. Include diagnosis, fixes, deployment and verification.

• Include backend defects, security patches, vulnerability remediation, monitoring/alert response, agreed dependency/API compatibility maintenance and app-to-backend fault diagnosis. Use controlled releases and rollback.

• Maintain/test backups and recovery; investigate incidents, restore recoverable service/data and report lost or unreconciled records. Follow DEC access and incident procedures.

SUP-NEW-03 | Support channels and response targets

Provide a staffed or on-call 24/7 telephone route and a ticket/email channel, with named escalation contacts. Automated acknowledgements alone do not count as a human response. The following are DEC proposed contractual targets for supplier acceptance; define severity examples and measurement before signing.

Priority	Human response / service action target
P1 - critical	Whole dispatch outage, suspected serious security incident or major data-integrity failure: response within 15 minutes; continuous work; containment or safe service restoration/workaround target within 4 hours.
P2 - high	Major backend function unavailable with limited workaround: response within 1 hour; restoration/workaround target within 8 hours.
P3 - routine	Non-critical backend fault or support query: response within 4 hours; agree the resolution date in the ticket.

SUP-NEW-04 | Escalation and accountability

Use elapsed hours for these targets, including nights/weekends. Critical tickets require regular progress updates at least hourly until stable. Record incident times, actions, workaround, resolution and follow-up; give DEC a written cause/prevention report for major incidents. Define escalation and agreed remedies for missed targets. Never close a ticket solely because a time target has elapsed.

SUP-NEW-05 | Charges and external dependencies

No extra subscription, call-out, labour, out-of-hours or included-fix fees during the 24 months. Itemise hosting and third-party/usage costs separately before contract. New features require separate DEC approval. Third-party outages still require diagnosis, escalation, updates and recovery support; disclose external restoration limits.

SUP-NEW-06 | Acceptance, continuity and renewal

Retain baseline app-store/mobile maintenance obligations and ownership controls. Demonstrate support channels, out-of-hours escalation, monitoring and a recovery exercise before production acceptance (AT-C11). Include this clause in the signed scope and price schedule; document any supplier exception for DEC decision. Supply renewal terms/pricing at least 90 days before expiry, with no automatic paid renewal without DEC agreement. Preserve exit assistance and data access.

01 / DEVELOPER SPECIFICATION

UK Fleet & Workforce Management

Developer requirements and acceptance brief

Prepared for DEC
DEC

Version 1.5 | 27 October 2026 | For developer quotation and implementation

Objective

Create a company-owned fleet platform with the functional coverage of AssetGo's publicly described modules, plus driver and Passenger Assistant (PA) profiles, safeguarding, PAT/MiDAS training and restricted DBS records. Deliver a management website and driver/PA apps for iOS and Android.

Main reference website for the developer

https://assetgo.co.uk/
Use AssetGo as the main reference for the features and workflows required. Review all published solution modules alongside this specification. If anything is unclear, use a client-authorised demonstration of the existing system to confirm the required behaviour and document any gaps before development.

Mandatory business priorities

Automatic driver licence checks; separate six-month and annual MOT/inspection deadlines; reminders one calendar month before each deadline; daily vehicle checks; checklists editable from the management dashboard; evidence-based release of unsafe vehicles; restricted personnel records.

Scope and compliance boundary

This is a build specification, not a claim that every private AssetGo screen has been inspected. The supplier must verify full parity against a client-authorised demonstration and record gaps before agreeing the final scope. Build original code and branding. No AssetGo approval or accreditation transfers to the new system.

UK operation is the target. Initial rule profiles must cover the actual Luton and Central Bedfordshire licences and contracts used. Other UK authorities and nations require their own validated profiles. Legal, council and contract requirements must be reviewed before launch and maintained afterwards.

How to use this brief

All requirements are mandatory unless expressly marked conditional. Quote conditional modules separately, including their activation prerequisites. Source references [S1-S17] appear on pages 11-12; integration and legal additions appear on pages 13-16. Business additions and proposed acceptance targets are requirements, not claims about AssetGo.

VERSION 1.5 UPDATE
Read pages 17-20 with this specification: firm iOS/Android app delivery, offline safety, DEC and unlimited sub-company access, scope/pricing, milestone acceptance, support, ownership and AT-17 to AT-24. All original requirements remain in scope.

Module coverage and system structure

Module	Required coverage	Detail
Fleet and asset management	Vehicles, equipment, depots, assignments, custom dates	3
Daily checks and checklist builder	Mobile checks, photos, offline use, version history	4
Defects, maintenance and workshop	Repair lifecycle, planner, inspections and costs	5
Driver and PA management	Profiles, availability, onboarding and training	6
Licence checking and DBS assurance	Authorised checks, permission and review workflow	7
Expenses, incidents and grey fleet	Fuel, damage, insurance and personal business vehicles	8
Tachograph and Earned Recognition	Full scope; activation conditional on applicability/approval	8
Documents, messaging and reporting	Secure records, alerts, exports and custom dashboards	9
Security and technical delivery	Access controls, APIs, migration, testing and handover	9-10

Platform requirements

SYS-01 | Company structure. One owner dashboard with company, depot and team filters. Separate access by legal entity; record which company operates each vehicle and employs/contracts each person. Shared staff or assets require explicit permissions and assignment history.

SYS-02 | User interfaces. Responsive office dashboard, driver mobile app, PA mobile access and restricted workshop portal. The PA interface must not require a driving licence for a non-driving role.

SYS-03 | UK conventions. GBP; miles; litres; kWh for EVs; DD/MM/YYYY display; Europe/London scheduling including daylight-saving changes; UTC audit timestamps; UK registration and postcode support.

SYS-04 | Status model. Use ready, due soon, blocked and verification pending statuses. Show underlying reason, data source, last verification time and responsible reviewer; never equate missing data with compliance.

Published module baseline: AssetGo fleet/driver, workshop, licence, grey-fleet, tachograph and Earned Recognition offerings [S1-S10].

Vehicles, MOTs and deadline automation

VEH-01 | Vehicle master. Registration, VIN, make/model, year, fuel, mileage, seating, wheelchair capacity, ownership/lease, operating company, depot, licensing authority, plate number/expiry, insurance and documents. Include ramps/lifts and other equipment with separate inspection schedules.

VEH-02 | Two independent deadlines. Store official annual MOT/certificate expiry separately from council-required six-month MOT, inspection or compliance-test due date. Also track annual council compliance testing where separate. Do not derive every deadline from the latest MOT API expiry.

VEH-03 | Council-specific rules. Record inspection type, applicability, due-date calculation, vehicle age conditions, permitted depot, source, effective date and reviewer. Do not apply a universal six-month rule to every UK vehicle. Central Bedfordshire states its six-month MOTs must use designated depots from 30 March 2026 [S12]. Validate Luton rules against its current policy and licence conditions [S13].

VEH-04 | Reminder timing. For BOTH six-month and annual deadlines, notify one calendar month before the due date, clamping to the final day of the preceding month where needed. Example: 31 March 2027 produces a 28 February 2027 reminder. Optional additional reminders: 14, 7 and 1 day before; overdue alerts daily until resolved.

VEH-05 | Recipients and evidence. Notify responsible manager and assigned driver by email and push; optional SMS. Retain queued/sent/failed/acknowledged states. Retry failures and escalate to an alternative manager. Newly entered already-due records must alert immediately.

VEH-06 | Bookings and completion. Store booking date/time, garage/depot, confirmation, test date, result, certificate and next deadline. Booking alone never clears an expired requirement. Preserve failed tests and advisories; renewal requires verified evidence.

VEH-07 | Vehicle verification. Integrate official/authorised MOT and tax data where available. Preserve provider, check time and result. Unknown/stale data requires review. Insurance cover and council plates require their own verification; MOT/tax data does not prove hire-and-reward insurance.

VEH-08 | Availability gate. Block new work assignments when a required MOT, licence, insurance or council inspection is expired, or a critical defect is open. Show reasons and replacement options. No ordinary override of confirmed legal invalidity.

National testing guidance explains annual testing and local authority variation [S11]. Council six-month deadlines and annual certificate expiry must remain independently visible.

Daily checks and dashboard checklist builder

CHK-01 | Self-service authoring. Managers can create, duplicate, edit, reorder, publish and archive checklists without coding. Support sections, instructions, pass/fail/N/A, yes/no, text, numeric values, selection lists, mandatory photos and notes. N/A requires a reason where configured.

CHK-02 | Assignment and versions. Assign by company, council, vehicle type or individual vehicle. Maintain publication date, author and effective version. Every submitted check retains the original questions, answer rules and responses; later template edits never rewrite history.

CHK-03 | Driver workflow. Log in; confirm vehicle/shift; enter mileage; view existing defects; complete each item; capture evidence; declare accuracy; sign and submit. Record start, finish, submission and server receipt times. Capture location only where justified and disclosed.

CHK-04 | Suggested starting checklist. Tyres/wheels; lights/indicators; brakes/steering; horn; mirrors/glass; wipers/washers; fluid leaks; seat belts; doors/locks; warning lights; cleanliness; licence plates; fuel/charge; first-aid/fire equipment where required; ramp/lift/restraints for wheelchair vehicles. Validate templates against each applicable vehicle and council rule.

CHK-05 | School-run additions. Include child locks as applicable, seating/restraints, cleanliness and an end-of-run vehicle sweep confirming no passenger or belongings remain. Support driver/PA countersignature when required by the contract. Do not capture passenger names in general check reports.

CHK-06 | Critical failures. Each configured safety-critical failure opens a linked defect, marks the vehicle off-road and alerts management. Manager review can classify a non-critical item for monitoring, with reason and review date.

CHK-07 | Offline operation. Encrypted local drafts and photos; clear pending-upload indicator; automatic retry after reconnection; duplicate prevention; safe conflict handling. Server receipt time must not replace the actual completion time. No false manager visibility while offline.

CHK-08 | Evidence and exceptions. Submitted checks are locked; corrections are separate, attributed records. Allow roadside access to recent reports. Flag missing checks for vehicles actually scheduled for work; record approved absence/non-use. Flag implausible mileage or unusually short duration for human review.

AssetGo describes checklist customisation, photo/note requirements, critical failures, retained versions and locked submitted reports [S2]. Offline resilience and school-run additions are explicit client requirements.

Defects, maintenance and workshop

DEF-01 | Defect record. Vehicle, originating check, reporter, time, severity, category, description, photos, safety impact and status. Show existing defects to avoid duplicate work while allowing new evidence or deterioration to be reported.

DEF-02 | Repair lifecycle. New > triaged > assigned > booked > repair complete > independently verified > closed. Also allow monitored, rejected duplicate and reopened states, with reasons and a complete event history.

DEF-03 | Repair allocation. Assign in-house mechanic or approved external garage; share only the necessary vehicle/defect information. Track owner, priority, target date, estimate, work order, parts, labour, invoice, warranty and downtime.

DEF-04 | Return to service. Record repairer sign-off, supporting evidence and authorised second-person verification for safety defects. Release only when all blocking requirements are satisfied. Preserve the identity and timestamp of the release decision.

MNT-01 | Service schedules. Recurring date and/or mileage triggers; manufacturer schedules; vehicle-specific intervals; preventative maintenance inspections (PMIs); brake tests where applicable; tyre inspections and equipment inspection dates. The earlier applicable trigger governs.

MNT-02 | Workshop planner. Day/week/month views of jobs, technicians, garage slots, vehicle downtime and due dates. Prevent double-booking and expose conflicts with planned vehicle use. Rescheduling must not erase the original missed deadline.

MNT-03 | Inspection forms. Custom technician inspection checklists; measurements, photos, notes, pass/fail results and signatures. Completing a form is a record of inspection; the app does not itself issue an official MOT certificate.

MNT-04 | History and reporting. Vehicle timeline joining daily checks, defects, servicing, tests, repairs and costs. Export a readable inspection/repair pack with evidence links, dates and signed approvals.

MNT-05 | Notifications. Immediate safety alerts; approaching maintenance deadlines; overdue work and monitored-defect reviews. External garage messages require approved recipients and a logged send action.

Baseline: AssetGo defect management, maintenance/PMIs and workshop functionality [S3-S4]. Status wording and blocking logic above are proposed implementation requirements.

Driver, PA and training profiles

PEO-01 | Person record. Separate driver, PA and dual-role profiles. Record name, staff ID, contact details, emergency contact, company, start/end date, employment/contract status, assigned depot, availability and approved duties. Identity and right-to-work evidence must have restricted access.

PEO-02 | Driver credentials. Driving licence number, entitlement and photocard expiry; council badge number, authority and expiry; relevant medical review; insurance eligibility; professional cards where applicable. Store verification source and reviewer separately from uploaded documents.

PEO-03 | PA credentials. PA authorisation/ID, induction, safeguarding, relevant assistance skills and council/contract approvals. Attach only necessary supporting evidence. A driving licence is required only for a driving role.

TRN-01 | Training register. Record safeguarding, PAT, MiDAS, disability awareness, wheelchair restraint/lift use, first aid and other assigned training. Fields: course, provider, certificate/reference, completion, assessment result, expiry if specified, review date, evidence and verifier.

TRN-02 | Role requirements. Create requirement sets by driver/PA role, council, school contract and vehicle capability. Set course validity from the actual certificate, provider or contract; do not assume universal statutory PAT/MiDAS renewal intervals.

TRN-03 | Training delivery. Book sessions, record attendance, assessor/trainer details, competence results, resits and refresher actions. Store assessor qualifications and review dates for in-house delivery. Training records do not confer provider accreditation.

PEO-04 | Eligibility and allocation. Show operational clearance separately for driving, PA duties and specialist work. Block assignments lacking required credentials or training. Controllers see clearance and due dates, not confidential DBS or medical detail.

PEO-05 | Workforce planner. Shifts, leave, absence, driver-vehicle allocation and driver/PA pairing, with assignment history and conflict detection. Offboarding revokes access, stops unnecessary checks and applies retention rules.

PEO-06 | Safeguarding cases. Separate confidential case area with named safeguarding officers, action deadlines, attachments, decisions and disclosure history. General incident access must not expose safeguarding narratives. Urgent safeguarding escalation must not depend solely on app notifications.

AssetGo driver management covers records, key dates, training and availability [S5]. PA, safeguarding and PAT/MiDAS workflows are additional client requirements.

Automatic licences and DBS review controls

LIC-01 | Authorised integration. Use an authorised DVLA Access to Driver Data route or contracted checking provider. Supplier must document onboarding, permitted use, driver permission/declaration, supported licence jurisdictions, fees and access limits. Northern Ireland and overseas coverage must be confirmed separately [S14].

LIC-02 | Automated schedule. Run at onboarding and on an approved risk-based schedule; permit authorised on-demand checks. Record points, endorsements, disqualification/status, vehicle categories/restrictions and expiry dates. Compare with the last successful result and notify authorised managers of changes.

LIC-03 | Reliability and review. Display last/next check, declaration validity, failed/pending status and source. Retry outages without reporting success. Deduplicate chargeable requests. A new endorsement triggers review under policy; confirmed invalid entitlement blocks driving. Checks are scheduled lookups, not guaranteed instant change notifications.

DBS-01 | Restricted metadata. Record certificate reference, issue date, check level/workforce, original certificate seen by whom/when, relevant barred-list eligibility, Update Service participation, consent, latest status result, next review and suitability decision. DBS certificates do not have a universal statutory expiry; use review/renewal dates.

DBS-02 | Status checking. Only perform Update Service checks where the organisation is legally eligible, has permission, and the certificate level/workforce matches. Record manual checks or use a demonstrably authorised supported service; do not assume a public automation API exists. Changed status triggers a restricted review and appropriate new-check process [S15].

DBS-03 | Retention and disclosure. Default to necessary metadata and recorded suitability, not permanent certificate images or conviction narratives. Any retained certificate information needs documented justification, restricted access and a deletion schedule. Log every access, download and authorised disclosure [S16].

DBS-04 | Operational visibility. Controllers see only cleared / pending / restricted and next review date. Drivers/PAs access their own appropriate records. Only explicitly authorised HR/vetting/safeguarding staff access supporting DBS material.

DVLA checking and DBS review are different services. Neither confirms that the council driver badge, training, medical clearance or all job-specific requirements remain valid. These need separate verification.

Costs, incidents and specialist modules

FIN-01 | Expenses and fuel. Record vehicle/driver, mileage, litres or kWh, unit price, total, VAT where relevant, supplier, receipt, date and approval. Include AdBlue, parking, charging, servicing, parts, labour and incident costs. Flag anomalous mileage/consumption; export to accounts.

INC-01 | Accident reporting. Mobile forms for time/location, description, weather, photos, involved vehicles/people, witnesses, third-party insurer and police reference. Link damage, repairs, claims and costs. Restrict injury and passenger information; authorised sharing only.

GRY-01 | Grey fleet. Register employee-owned vehicles used for business; monitor MOT, tax and evidence of appropriate business insurance. Weekly automated MOT/tax status checks where supported. Taxi work requires verified hire-and-reward cover; generic business-use insurance is insufficient.

TAC-01 | Tachograph scope - conditional activation. Retain as a quoted module for complete AssetGo published coverage. Activate only for applicable vehicle/operation rules. Include driver-card and vehicle data import, remote downloads, company-card hosting through supported partners and missing/late download alerts.

TAC-02 | Analysis and action. Applicable assimilated EU/UK and GB domestic rules, driving/rest/working-time analysis, infringements, driver acknowledgement, escalation, unaccounted mileage and fines records. Provide driver/vehicle reports, scheduled downloads and a signed-off rule applicability matrix. Validate the rules engine with specialist test cases [S9].

ER-01 | Earned Recognition - conditional activation. Include maintenance and drivers-hours KPIs, threshold alerts, evidence history and scheme reporting/integration where applicable. Obtain the required supplier approval and operator eligibility before claiming scheme support. The new product cannot inherit AssetGo's authorisation [S10].

INT-01 | Other integrations. Document APIs, permissions and charges for MOT/tax, licence checks, push/email/SMS, accounting, trackers and supported tachograph providers. An API listed on AssetGo's website does not grant access to AssetGo customer data.

Baseline sources: expenses [S6], incidents [S7], grey fleet [S8], tachograph [S9], Earned Recognition [S10]. Specialist modules remain in the scope even if not activated for the current taxi fleet.

Dashboard, permissions and data protection

DASH-01 | Operational overview. Configurable cards for available/off-road vehicles, missing checks, critical/open defects, tests due, overdue servicing, driver/PA clearance, expired documents and training reviews. Drill down by company, council, depot and date.

DOC-01 | Records and messages. Searchable documents with entity links, version, owner, verification and retention dates. Policy acknowledgements and secure messages. Alerts must carry minimal sensitive information and link to authenticated records.

REP-01 | Reporting and audit. Scheduled reports; filters; PDF/CSV/Excel export; vehicle compliance packs; check completion; defect ageing; repair costs; credential/training due lists and an access-controlled audit history. Exports must respect the same permissions as screens.

Role	Operational access	Restricted personnel information
Owner / company manager	Assigned companies and reports	Only with a separate explicit vetting permission
Controller	Assignments, checks and clearance status	No DBS details, medical detail or safeguarding cases
Driver / PA	Own profile, assigned duties and permitted reports	Own permitted records only; no colleagues' data
Mechanic / garage	Assigned vehicle repairs and inspection evidence	No personnel vetting or safeguarding records
HR / vetting / safeguarding	Relevant people and assurance tasks	Explicit purpose-based access; safeguarding cases separate
Auditor / support	Read-only or time-limited access as approved	Redacted by default; access logged

SEC-01 | Technical safeguards. Server-enforced entity/record/field permissions; administrator MFA; secure password reset; encryption in transit and at rest; private file storage and expiring links; upload malware checks; session revocation and logged access to sensitive data.

SEC-02 | UK data protection. Document lawful bases, criminal-offence/special-category conditions where relevant, controller/processor agreements, privacy notices, retention schedules, rights requests and breach response. UK hosting is preferred; overseas access/transfers need separate assessment. Assess monitoring with a DPIA where required [S16 and S17 on page 12].

Delivery, testing and developer quotation

ENG-01 | Architecture. Separate app/dashboard, authenticated backend, relational database, private document storage, background job queue and notification service. Use a maintained technology stack proposed by the supplier. Implement API throttling, idempotency, retries, monitoring and environment separation.

ENG-02 | Migration and resilience. Import available AssetGo exports and attachments with source IDs, timestamps and reconciliation. Identify non-exportable data early. Agree recovery objectives; proposed baseline: daily backups, 24-hour maximum data loss and restoration within one working day. Demonstrate a restore.

ENG-03 | Proposed service targets. Agree expected vehicle/user counts and load before fixed-price sign-off. Target ordinary pages loading within 2 seconds under agreed load, online critical alerts queued within 60 seconds and expiry jobs evaluated daily. External delivery delays and failures must remain visible.

Mandatory acceptance demonstrations

AT-01: Annual and six-month dates remain independent after an API update.
AT-02: One-calendar-month reminders pass month-end, leap-year and daylight-saving tests; failed delivery escalates.
AT-03: Editing a checklist leaves historical submissions unchanged.
AT-04: Offline check/photos synchronise once with correct completion and receipt times.
AT-05: Critical defect blocks allocation until repair and authorised verification.
AT-06: Licence checks handle changed results, expired permission and provider outages.
AT-07: Controllers cannot access DBS files via screens, exports, APIs or copied file links.
AT-08: Driver/PA eligibility reflects training, badge, DBS review and applicable contract rules.
AT-09: Imported record/attachment totals reconcile; a backup restores successfully.
AT-10: Conditional tachograph/ER modules pass specialist validation before activation.

Quote and handover requirements

Provide a line-by-line compliance response to every requirement ID; a feature-parity matrix; designs; delivery milestones; integration contracts; one-off and recurring charges; migration plan; acceptance evidence; security test findings and remediation; support SLA; warranty; training and user guides.

Company ownership of custom source code, database, hosting and app-store accounts is required. List third-party licences separately. Deliver repository access, deployment scripts, configuration documentation, database schema, API documentation and a full usable data export. Include a defined end-of-contract migration process.

Recommended sequence: discovery/rule validation > core records and checks > defects/MOT/licence automation > personnel assurance and remaining modules > migration, pilot, acceptance and rollout. Delivery order does not remove modules from scope.

Source register: AssetGo feature baseline

Public sources reviewed for this brief, 26 October 2026. Links are clickable. Source descriptions establish the module baseline; specific business workflows and acceptance criteria are proposed requirements. Do not reuse marketing claims as proof of legal compliance.

Parity verification required before final contract

Supplier must examine each client-authorised AssetGo screen/report used, document configuration and permissions, and mark every feature as included, integration-dependent, conditional, or a confirmed gap. Resolve gaps explicitly; the public website does not expose all private behaviours or data-export limitations.

Decisions required during discovery

Confirm vehicle/driver/PA counts; actual licensing authorities and school contracts; applicable inspection intervals/depot restrictions; notification recipients; licence-check provider and frequency; training review rules; authorised vetting staff; existing trackers; data exports available; retention policy; and whether specialist modules apply now or later.

Compliance ownership

Assign a business compliance owner to approve the initial rule register and review legal, council, insurer and contract changes. Each rule needs a source, jurisdiction, effective date, reviewer and next review date. The supplier must support controlled rule updates without changing historical records.

DBS requirements in this brief refer to the DBS system. Scotland and Northern Ireland require separate disclosure-service rules where applicable. Launch approval must confirm the relevant jurisdiction and service coverage. A feature checklist is not a substitute for validated operating procedures.

Official UK authority connections

Version 1.1 addition | These connections are implementation requirements. They have not been registered or activated by preparing this document. Use official services directly where approved, or a contracted authorised provider with equivalent evidence and provenance.

Authority / service	Required integration	Limits and prerequisites
DVLA - Access to Driver Data (ADD)	Automated driving-record checks; entitlements, restrictions, points and status	Authorised access/provider contract, driver permission, jurisdiction coverage and approved schedule.
DVSA - MOT history API	Test history, results, dates, mileage, failures/advisories and expiry where available	Register and obtain production credentials. Use current OAuth/API-key requirements and service limits.
DVLA - Vehicle Enquiry Service (VES)	Vehicle identity, tax/SORN and available MOT summary fields	Separate registration/API key. This does not verify driver entitlement, insurance or council licensing.
Licensing councils / TfL where used	Driver badge, vehicle plate, operator licence, conditions and council-test evidence	Use an authorised supported integration if available; otherwise staff verify via official records/council confirmation.
DBS / other national disclosure bodies	Eligible status checks and evidence of vetting review	Permission, role eligibility and correct service required; no assumed unrestricted public automation API.

AUTH-01 | Connection register. Record authority, service/API version, approved purpose, registration owner, provider contract, support contact, permitted fields, coverage, check frequency, cost, rate limits and renewal/review date. Store secrets only on the backend in a managed secret store.

AUTH-02 | MOT synchronisation. Use current DVSA MOT history documentation [S18-S19]. Import tests using stable test identifiers and retain history. Update official certificate fields only; never overwrite council six-month deadlines. Surface failures/advisories for manager review. Refresh on onboarding, scheduled checks and after a booked test; respect API limits.

AUTH-03 | Verification integrity. Store retrieved time, source and reference for each result. Show stale, pending, failed and conflicting results. Retry with backoff, alert after repeated failures, and require reviewed fallback evidence. No website scraping or shared government login credentials as a substitute for approved integration.

Official MOT history is provided by DVSA; DVLA provides driver records and VES vehicle information. Neither service provides a complete garage service history, repair invoices or all local council inspection deadlines [S14, S18-S20].

Legal requirements and release assurance

LAW-01 | Compliance matrix. Before production, map each applicable obligation to a source provision/licence condition, jurisdiction, vehicle/role scope, system control, operating procedure, evidence, owner and acceptance test. Classify entries as law, statutory guidance, council condition, contract/insurer rule or internal policy. Do not present every recommendation as legislation.

LAW-02 | Jurisdiction. Validate England, Wales, Scotland and Northern Ireland separately before use there. Include the actual council/TfL requirements, PHV/operator licensing model, vehicle category and contract conditions. An England taxi profile is not a universal UK ruleset.

LAW-03 | Roadworthiness and licensing. Require valid applicable driving entitlement, vehicle testing, tax, insurance, driver badge, vehicle licence and operator authorisation. Validate lawful driver/vehicle/operator combinations and subcontracting arrangements against the actual licensing model. A valid MOT alone never proves current roadworthiness.

LAW-04 | Passenger safety and equality. Record wheelchair capability, restraint/lift competence, required equipment checks, relevant assistance training and verified lawful medical exemptions. Include assistance-dog and disability duties in policies/training and incident review. Do not impose disability-related booking restrictions or surcharges contrary to applicable law [S22].

LAW-05 | School transport safeguards. Translate each council contract into role eligibility, safeguarding training, vetting review schedule, incident reporting and end-of-run checks. Retain accountable human suitability decisions. PA requirements must be validated independently of taxi-driver badge requirements.

LAW-06 | Privacy and personnel records. Apply UK GDPR and Data Protection Act requirements, as amended, with specialist review of criminal-offence and health information. Set justified retention by record class, national disclosure scheme and applicable contracts. Complete required assessments for monitoring, disclose its use and restrict third-party access [S15-S17].

LAW-07 | Maintenance evidence retention. Where the DVSA commercial goods/passenger-carrying roadworthiness regime applies, configure its minimum 15-month safety-inspection retention, including disposed vehicles [S21]. Do not assume this is a universal retention rule for all taxi/personnel data. Apply longer justified contractual/legal periods where needed.

LAW-08 | Production release gate. Supplier supplies the completed obligation matrix and test evidence. Business compliance owner and appropriately qualified UK licensing/data-protection advisers resolve applicability and critical gaps before live use. Repeat review after material rule changes. No blanket UK-legal-compliance or government-approval claim without substantiation.

The one-month reminder is a client operating requirement. It does not extend legal expiry, authorise driving an unsafe vehicle, or replace inspections and licence conditions. Automated screening supports compliance; qualified people remain responsible for operation and decisions.

Service records, repairs and due reminders

SRV-01 | Complete service record. For every service store vehicle ID/registration, service type, date, odometer and unit, garage/technician, work performed, checklist, fluids/parts, labour, invoice, warranty, advisories, sign-off and evidence. Permit dated import of older records with a clear source.

SRV-02 | Next service calculation. Store manufacturer and approved fleet date/mileage intervals with source and effective version. Calculate the next due date and due odometer after a verified service; trigger on whichever comes first. Allow fixed-interval schedules where specified. Do not automatically change schedules using an unverified invoice upload.

SRV-03 | Service reminders. Mandatory date reminder one calendar month before service due, plus configurable 14/7/1-day reminders. Add mileage thresholds, for example 1,000 and 500 miles remaining, configurable per vehicle. Notify manager and assigned driver; record acknowledgements, failed delivery and escalation. Raise overdue tasks until verified completion.

SRV-04 | Mileage freshness. Update from driver checks, fuel/charging entries or authorised telematics. Flag decreasing/inconsistent or stale mileage. Estimated due dates must show their basis and must not replace actual odometer thresholds. If mileage is unknown, request an update rather than report the vehicle as in date.

SRV-05 | Linked repair and cost ledger. Link each defect, service, inspection and accident to its work orders. Record quoted/approved/actual costs, parts quantities, labour hours/rates, VAT treatment, invoice/credit reference, supplier, payment status and approving user. Calculate per-job, per-vehicle and fleet totals without double-counting linked invoices.

SRV-06 | Approval and release. Set spending authorisation limits and require approval for excess costs. Capture repair completion and independent safety verification where required. Service completion must not close unrelated defects, clear MOT/council expiries or release an otherwise blocked vehicle.

SRV-07 | Updates and audit. Garage staff can update only assigned jobs; management approves corrections. Preserve original entries, correction reason and author/time. Dashboards show upcoming service, overdue work, maintenance downtime, repair spend, warranty work and cost per mile.

Additional mandatory acceptance tests

AT-11: Demonstrate authorised DVLA licence and VES connections and DVSA MOT retrieval, including permission errors, outages and stale data.
AT-12: An MOT update changes annual certificate data without shifting the six-month council deadline.
AT-13: A service triggers first by date, then by mileage in separate test cases; reminders reach both recipients.
AT-14: One invoice linked to service and repair appears once in cost totals; credits and approvals remain auditable.
AT-15: Completing a service leaves an unrelated safety defect blocked.
AT-16: Compliance matrix, jurisdiction profiles and access/retention tests are signed off before production.

https://www.gov.uk/check-driving-information

Developer connection handover checklist

Provide proof of service registration/provider authority; approved purposes and driver declarations; production/test separation; credential ownership and rotation procedure; API documentation/version; rate limits; charging schedule; monitoring dashboard; retry/fallback runbook; result provenance and retention policy; and successful acceptance demonstrations. Keep client secrets and live personal records out of this PDF.

Council verification and remaining limitations

Council licensing, specialist inspection and insurance verification must each have an evidenced route. If an authority offers no supported integration, supply the official verification workflow, assigned reviewer and review reminder. Label this as manual verification; do not display a false live government connection.

Developer reference

https://assetgo.co.uk/ - primary product reference. Version 1.2 adds this website prominently to the brief. Confirm unclear functions against AssetGo and the client before implementation.

Revision record

Version 1.1 adds explicit DVLA/DVSA authority routes, a legal obligation and release matrix, detailed service/repair/cost records and service due reminders. It retains all previously specified AssetGo-based modules and driver/PA safeguarding requirements. Legal applicability and operational compliance remain subject to validated jurisdiction rules and continuing review.

17 / Staff apps and offline safety

Version 1.5 addition | Binding clarification of SYS-02, CHK-03/05/07, FIN-01 and INC-01.

APP-01 | iPhone and Android delivery

Deliver installable iOS and Android staff applications, connected to the same authenticated backend/database as the office dashboard. One role-based app or separate driver/PA apps is acceptable if all required workflows and permissions are delivered. A shared cross-platform codebase is acceptable. A PWA or mobile website is a proposed substitution and requires DEC's written agreement before contract; unspecified "mobile access" is insufficient.

APP-02 | Devices, distribution and approval

Before scope sign-off, identify framework, supported phone/OS versions, device/camera/storage requirements, accessibility approach, installation/distribution route and app-store submission responsibility. Specify client-owned accounts, signing credentials, build ownership, store-review dependencies and handling of rejection/resubmission. Provide mobile designs and working demonstrations on both platforms. Distribution may be public or an agreed supported private route; do not assume store approval.

APP-03 | Daily staff workflows

Apps must support login, own duties/vehicle/shift, mileage and fuel/charge entry, existing-defect visibility, daily checklists, required camera/photo/notes, signature/declaration, submission receipt/history and permitted recent reports. Include defect and incident reporting; own permitted documents/training; fuel, charging and AdBlue entries with receipts; reminders and acknowledgement. Role permissions determine access. PA-only staff must not need a driving licence. Include school-run sweep and required driver/PA countersignature.

APP-04 | Offline drafts, logout and shared devices

Implement CHK-07 on both platforms. Encrypt local drafts/photos and isolate users. Keep clear pending, failed and received states. Preserve completion and server-receipt times; retry after reconnection without duplicate submissions or attachments. Define crash/restart, storage-full, interrupted-photo-upload and conflict handling. Before logout, warn of unsent work and offer a secure recovery path; do not silently lose drafts or expose the previous user's records. Agree retention/purge and support recovery procedures.

APP-05 | Safety status while disconnected

A new critical defect must show an immediate local do-not-use warning even before upload. Display last-synchronised status and flag when server clearance cannot be verified. Offline activity must never release a blocked vehicle or imply management received a check. Agree a documented stop/escalation and verification procedure for critical defects, unknown clearance and unresolved checks. Final release requires the authorised server workflow; offline mode is not an exemption from safety controls.

APP-06 | Notification and app lifecycle

Verify push/email permission, token expiry, failed delivery and escalation behaviour. Critical escalation must have a documented alternative when the phone is offline or notifications are disabled. Define app update/version compatibility, backend upgrade/rollback and supported OS update procedures. Share only minimal sensitive information in notifications; opening records requires authentication.

18 / Companies, scope and pricing

Version 1.5 addition | Supplements SYS-01, AUTH-01/03, SEC-02 and quotation requirements.

ORG-01 | DEC and unlimited sub-companies

Provide DEC with one owner dashboard and unlimited sub-company access. Authorised DEC administrators must create, rename, manage and archive sub-companies without developer intervention, a fixed software cap or extra per-company licence charges. Map each to its actual operating/employing legal entity. Keep company/depot/team filters, separate role permissions and explicitly authorised sharing with assignment history. Enforce separation across screens, APIs, reports, exports, file links and jobs. Agree infrastructure capacity and external usage costs separately; these must not impose a sub-company licence limit.

SCP-01 | Full requirement response

Before approval, supply a matrix for every requirement ID in this version, including AUTH, LAW, SRV, APP, ORG, SCP, COM, DEL, SUP, HND and applicable AT tests. Record included/partial/excluded/conditional; precise solution; gap; dependency; one-off/recurring cost; milestone; test/evidence and responsible owner. Reconcile AssetGo workflow gaps. Existing mandatory requirements cannot be silently reclassified as optional or removed by an undefined "baseline".

SCP-02 | Integration commitment and limitations

For each authority/provider and tracker/accounting interface, distinguish technical assessment from a delivered working integration. State the approved route, functions/fields, access prerequisites, responsibilities, schedule, costs and acceptance evidence. Any unsupported connection must have an evidenced manual alternative, reviewer, reminder and visible status, agreed by DEC. Changing a mandatory live connection to a manual process requires explicit written scope agreement; do not label a manual check as automated.

SCP-03 | Conditional modules and discovery

Quote tachograph and Earned Recognition separately, retaining their applicability/approval conditions. Identify unresolved discovery items, decision owner, decision date and effect on cost/timing. Written acceptance of a change is required before additional work or substitution. An external approval delay does not automatically remove the requirement. Maintain a dependency and scope-change register.

COM-01 | Price and recurring-cost schedule

The supplier's referenced proposal quotes USD 2,000, four USD 500 milestones and an estimated 22 days. These are quotation figures, not accepted terms or proof of full coverage. The revised offer must state whether the price includes both apps, offline checks, dashboard/backend, agreed integrations, testing, migration, deployment and handover. List exclusions and separately priced requirements. State currency, tax treatment, usage/user/vehicle/storage limits and cost assumptions.

COM-02 | External services and delivery timetable

Itemise hosting, storage, backups, email/SMS, licence-check/API providers, app-store accounts, monitoring, maintenance and support; distinguish setup, subscription and usage charges. State who contracts/pays and owns accounts. Provide a dependency-based timetable covering design, build, integrations, migration, pilot, fixes, distribution and handover. Explain the 22-day estimate and treatment of access, data, store-review and third-party delays.

SEC-03 | Support access and processors

Identify hosting regions, subprocessors and countries from which developers/support staff can access data. Document appropriate processing/transfer arrangements under SEC-02. Use approved, time-limited support access with audit history; do not use live sensitive records in development without approved safeguards.

19 / Acceptance, support and exit

Version 1.5 addition | Supplements ENG-01/02/03, security controls and handover obligations.

DEL-01 | Measurable milestones

Agree milestone evidence before payment approval. Proposed four-stage structure: (1) signed scope matrix, architecture, mobile designs, provider/dependency plan and price schedule; (2) demonstrated dashboard, entity separation and vehicle/staff records; (3) working iOS/Android checks, offline sync, defects, reminders and maintenance; (4) applicable tests passed, migration reconciled, pilot issues resolved, agreed deployment and full handover. An equivalent structure requires DEC agreement. Tie each invoice to its agreed evidence and acceptance decision.

DEL-02 | Test, pilot and acceptance procedure

Run AT-01 to AT-24 as applicable, using agreed representative vehicle, driver, PA and company data. Mark conditional tests with activation criteria; no silent omission. Supply results and defect register. Agree review periods, defect severity, correction/retest process, pilot size/duration, acceptance authority and treatment of blocked dependencies. Do not treat elapsed time, payment or initial deployment alone as proof of acceptance. Critical safety, access-control or data-loss failures must be resolved before production approval.

DEL-03 | Migration and recovery evidence

Agree specific AssetGo exports/attachments, mappings, historical IDs/timestamps, known non-exportable items, exclusions, reconciliation totals and failed-record reports before migration. Provide a cutover, rollback and continuity plan. Validate the ENG-02 backup/recovery objectives by restoring a usable test instance with its documents and permissions. Supplier must identify any proposed weaker recovery target for DEC decision before contract.

SUP-01 | Defect warranty and support agreement

Before contract, state warranty duration, start event, included fixes and exclusions; severity definitions; support hours/time zone; contact/escalation routes; response and restoration/resolution targets; out-of-hours arrangements and fees. Separate defect correction from paid enhancements. Record security-patch, library/framework, OS and API update responsibility, ongoing prices and review/renewal terms. Do not leave support as an unspecified post-handover exclusion.

SUP-02 | App-store and release maintenance

Assign responsibility and costs for initial submission, rejection remedies/resubmission, signing/certificate renewal, distribution and store-policy changes, supported OS releases and crash/notification issues. Include build/release instructions and test-account access. Explain how DEC or a replacement supplier can publish a signed update for both apps using DEC-controlled accounts.

HND-01 | Ownership and independent rebuild

DEC owns custom source code, database and business data as required by the original brief. Deliver repository access/history, reproducible dashboard/backend/mobile build and deployment instructions, environment/configuration templates without exposed secrets, schema, API documentation, licence list and administrator/staff guides/training. Confirm account transfer limits and separate third-party rights. Demonstrate an agreed deployment/build from the handed-over source; access to a running site alone is not handover.

HND-02 | Exit and access termination

Define usable export formats, attachments and relationships, export support/fees, end-of-contract assistance and account/credential handover or revocation. Preserve business access to data and required history. Return/delete supplier-held copies under the agreed retention/processing arrangements. Ensure DEC can appoint another maintainer without dependency on a developer's personal hosting, signing or service account.

20 / Verification and revision record

Version 1.5 | 27 October 2026 | Updated to require DEC and unlimited sub-company access.

Additional acceptance demonstrations

AT-17: Install and demonstrate every APP-03 role workflow on supported iPhone and Android devices. A PA-only account works without a driving licence.
AT-18: On both platforms, complete an offline check with photos; restart, reconnect and verify exactly one submission, original completion time and distinct server receipt. Test interrupted upload and draft recovery.
AT-19: A new offline critical defect shows do-not-use locally; stale clearance is visible; no offline release is possible. Reconnection alerts management and preserves the authorised repair/release gate.
AT-20: DEC administrators create and manage additional sub-companies without code changes, a software cap or per-company licence charges. Cross-company retrieval is denied through screens, APIs, exports and copied document links; authorised sharing is audited.
AT-21: Shared-device logout/account switching does not expose another user's data; unsent work is protected and recoverable under the approved procedure.
AT-22: Disabled notifications, expired tokens and offline phones show delivery failures and trigger the agreed alternative/escalation without leaking sensitive content.
AT-23: Demonstrate an independent agreed build/deployment from handover materials, usable export with attachments/relationships and revocation of supplier support access.
AT-24: Scope matrix, cost schedule, milestone evidence, warranty/SLA, distribution and lifecycle responsibilities are complete and accepted before final handover sign-off.

Comparison with the 15 clarification points

1-3 Apps, workflows and offline use: APP-01 to APP-06; existing SYS-02, CHK, FIN and INC controls; AT-17/18/19/21/22.
4 Companies: ORG-01 and SYS-01; AT-20.
5 Deadlines/service: existing VEH-02 to VEH-06 and SRV-01 to SRV-07; AT-01/02/12/13 retained.
6 Checklists/safety: existing CHK, DEF and VEH-08; APP-05; AT-03/04/05/15 retained.
7 Staff/training/safeguarding: existing PEO, TRN, LIC, DBS and SEC controls; AT-07/08 retained.
8 Connections: existing AUTH and LIC/DBS controls, plus SCP-02.
9 Maintenance/other modules: existing DEF, MNT, FIN, SRV, GRY, TAC, ER, INT, DOC and REP; SCP-03.
10 Security/recovery: existing SEC/ENG plus SEC-03 and DEL-03.
11-13 Scope/costs/milestones: SCP-01 to SCP-03, COM-01/02 and DEL-01/02.
14-15 Migration/ownership/support: DEL-03, HND-01/02 and SUP-01/02; AT-23/24.

Version control and interpretation

This is the complete version 1.5 requirements document: original pages 1-16 are retained, with version/date labels updated; pages 17-20 add enforceable detail. All original requirement IDs, conditional specialist modules, sources and AT-01 to AT-16 remain in scope. These additions clarify SYS-02: both drivers and PAs require the agreed iOS/Android app access, even though the earlier text uses "PA mobile access". Version 1.5 replaces the named-company setup with DEC and unlimited sub-company access. Where wording overlaps, apply the more specific v1.5 clarification; any departure requires DEC's written agreement.

Comparison sources: UK_Fleet_Management_Developer_Requirements(2).pdf (v1.3, 16 pages) and DEC_Developer_Clarification_Request(1).pdf (3 pages). Existing legal/source statements are retained from the supplied brief; this revision adds scope and delivery controls and does not independently recertify those sources or accept the supplier quotation.

Dispatch system requirements

DEC

Supplier and developer specification | Version 1.0 | 27 October 2026

Purpose and operating scope

Provide one reliable platform for DEC local private hire, airport transfers, executive and chauffeur travel, wheelchair transport, corporate accounts and school transport. DEC head office must control unlimited sub-companies or branches through appropriate permissions.

Reference platform and verification boundary

The private reference portal is withheld from this public copy. Its contents could not be accessed during the review. This document uses Cab Treasure public product descriptions as a reference and sets out recommended DEC requirements. It does not certify feature parity or confirm which modules are included in any subscription. [1-3]

Priority and supplier response

Treat the requirements in sections 1-12 as the procurement baseline. Suppliers must identify every exception. Items expressly marked optional may be priced separately. DEC should approve the final scope, tariffs and operating rules before implementation.

Supplier response	Required explanation
Included	Available now in the quoted package; demonstrate it.
Configurable	State setup work, responsibility and cost.
Extra cost	Name the add-on, integration and recurring charges.
Development	State deliverable, fixed price, dependency and delivery date.
Unavailable	Explain the gap and any practical alternative.

Recommended approach

Compare established dispatch platforms against this specification first. Consider a custom build where essential workflows cannot be met. Select on demonstrated operational suitability and total three-year cost, with acceptance tests agreed before signing.

01 / Company control

Group structure, booking responsibility and controller tools

1. DEC head office and unlimited sub-companies

• One DEC head-office account with group-wide oversight and unlimited sub-company or branch accounts. Supplier must disclose any company, user or volume-based limits and charges.

• Separate branding, booking links, telephone numbers, tariffs, customer accounts, invoice details and reports for each sub-company. Distinguish trading brands from separate legal entities.

• Share drivers and vehicles only through authorised rules. Support company-specific availability and restricted access to customer and financial information.

• Roles for owners, managers, controllers, accounts staff, drivers, Passenger Assistants (PAs) and corporate customers. Permission changes must be logged.

• Identify the licensed operator accepting each booking, its relevant licence details, and any authorised subcontracting history. Shared branding must not hide booking responsibility. [4]

2. Booking and controller dashboard

Area	Required behaviour
Channels	Telephone/manual entry, website, customer app and corporate portal. Official WhatsApp integration optional.
Journeys	Immediate requests, advance and return journeys, multiple stops, recurring bookings and saved templates.
Details	Passenger name, telephone/email, passenger and luggage counts, vehicle category, accessibility needs and necessary journey instructions.
Locations	UK postcode/address search, map pins, saved addresses and precise collection instructions.
Booking board	Unallocated, allocated, en-route, arrived, passenger onboard, completed, cancelled and no-show views.
Changes	Duplicate, amend, reassign and cancel with history, reasons and notifications to affected people.
Controller tools	Fast search, keyboard shortcuts, filters, multiple screens and simultaneous users. Avoid conflicting edits.
Customer service	Journey history, agreed prices, account terms, complaints and lost-property records.

Every booking request must have an explicit acceptance state. Confirmation must identify the accepted journey and price basis; a request must not be presented as a confirmed booking before acceptance.

02 / Dispatch and driver app

Allocation decisions must account for eligibility and future commitments

3. Manual and automatic dispatch

• Support manual allocation, configurable automatic allocation, operating zones, waiting queues and transparent priority rules.

• Consider current location, estimated arrival time, driver availability, vehicle category, luggage and passenger capacity, accessibility equipment and required training.

• Check driver, vehicle and operator licensing eligibility as well as existing jobs, travel between jobs, school commitments, breaks and shifts.

• Prevent overlapping assignments. Alert controllers to unaccepted/rejected jobs, lost connections, late arrivals and upcoming capacity shortages.

• Show why a driver is unsuitable and provide configurable offer deadlines and escalation. Operational overrides require permission and a recorded reason.

• Expired licences, invalid insurance and vehicles marked unsafe must remain blocked. Revalidate mandatory eligibility at dispatch and when the assigned driver or vehicle changes.

4. Driver application - Android and iPhone

• Secure login; approved driver-to-vehicle assignment; on-duty, unavailable and break statuses.

• Job offers and acceptance deadlines; journey details; navigation; controlled access to passenger instructions.

• En-route, arrived, onboard and completed statuses with timestamps; waiting-time records; approved extras and no-show evidence.

• Driver earnings, commission, cash collected and settlement statements. Document uploads and expiry reminders.

• Daily vehicle checks, defect photographs, incident reporting and an emergency alert linked to a defined office response procedure.

• Clear offline/GPS-loss status for drivers and controllers. Reconnect safely without duplicate job completion, charges or messages; do not suggest that stale positions are live.

Supplier demonstration requirement

Demonstrate location tracking and status updates on actual Android and iPhone devices, including background operation and loss of mobile data. Cab Treasure public materials describe configurable allocation, driver navigation and earnings features; package availability still needs confirmation. [2-3]

03 / Airport operations and fares

Protect confirmed commitments and make every fare explainable

5. Airport and executive transfers

• Record flight number, date, airport and terminal. Integrate flight status with clear failure alerts and manual fallback.

• Keep scheduled landing, actual landing and agreed collection time separate. Configure time after landing for immigration and luggage.

• Recheck driver availability after a flight change. Significant rescheduling must alert the controller and must not silently overlap school runs or other bookings.

• Support meet-and-greet instructions, passenger nameboards, airport collection guidance, linked return journeys and luggage suitability checks.

• Maintain airport pickup/drop-off fees with effective dates, waiting allowances and waiting charges. Show what the confirmed price includes.

• Support chauffeur bookings by journey, hour or day, including included mileage, overtime and additional distance.

6. Editable tariff engine

• Support included mileage followed by a per-mile rate, minimum fares, fixed routes/postcodes, and tariffs by vehicle, company and customer account.

• Configure waiting, extra stops, parking, airport fees, meet-and-greet, date/time supplements and discounts. Record whether each item is included or additional.

• Keep the passenger price separate from driver payment, commission and subcontractor cost. Apply VAT settings for the relevant entity and supply.

• Log authorised manual changes and reasons. Version tariffs so new rates do not retrospectively alter confirmed bookings.

• Agree an approved tariff sheet before configuration, including distance calculation, rounding, minimums, extras, amendment rules and worked examples. No tariff values are approved by this document.

Pricing acceptance examples

Test journeys below and above included mileage; each vehicle category; a fixed airport price plus parking; waiting beyond the free allowance; an amended return journey; a discounted account booking; and a price crossing a tariff effective date. The quote, confirmation, driver payment and invoice must reconcile.

04 / Accounts and school transport

Keep payment status separate from journey status

7. Payments, invoices and driver accounts

• Cash, cards, payment links, deposits and corporate credit accounts; PayPal where required by DEC. Use an established payment provider.

• Track paid, part-paid, unpaid, failed and refunded amounts separately from journey completion. Protect against duplicate charges and refunds.

• Support partial refunds, outstanding balances, account credit limits, purchase orders and cost centres.

• Generate weekly/monthly invoices with booking references, itemised extras, credit notes and accounting exports or a documented integration.

• Calculate driver commission, rent, adjustments, weekly statements, subcontractor charges and cash reconciliation. Define approval rights for financial changes.

8. School transport and Passenger Assistants

Area	Required behaviour
Contracts	Council/customer, route reference, contract dates, agreed daily prices and cancellation/billing rules.
Scheduling	Separate AM/PM runs, term calendars, holidays, exceptions and individual passenger absences.
Allocation	Regular driver, vehicle and one or more PAs; approved replacements and clash prevention.
Passenger support	Restricted access to necessary support instructions, emergency contacts and current risk assessments.
Attendance/handover	Timestamp collection, absence and delivery. Record authorised handover and escalate failed handovers.
Safety	Incident reports, emergency procedures and recorded end-of-route vehicle checks.
Communication	Notify authorised office, school and parent contacts of relevant changes.
Accounts	Reconcile completed runs, cancellations and approved extras against contract billing rules.

Any parent tracking access must be limited to the permitted journey information for their child. It must not expose other pupils' names, home addresses or sensitive support information. Demonstrate the escort/PA workflow with a real route scenario. [1]

05 / Compliance and information

Configurable controls aligned with DEC licences and contracts

9. Driver, vehicle and PA compliance

• Maintain driver licences, private-hire badges, vehicle licences, insurance, MOTs, council inspections and relevant checks. Record the reviewing person, date and evidence.

• Track PA checks and training required by each contract; manage vehicle service history, mileage, repairs, costs, defects and applicable wheelchair equipment inspections.

• Configure reminders, for example 60, 30, 14 and 7 days before expiry. Block allocation when a mandatory requirement is invalid.

• Name each proposed external source, access permission, cost, refresh frequency and manual fallback. MOT information, driving-licence checks and council licensing records are separate integration requirements. Do not assume universal access.

10. Booking records, privacy and security

Capture passenger name, request time, pickup, destination, driver name/licence number, vehicle registration, and the staff taking and dispatching the booking. DfT statutory standards list these fields and suggest a minimum six-month retention period. Configure retention to DEC's actual licence conditions, contracts and applicable obligations rather than hard-coding six months. [5]

• Individual staff logins, role-based access, administrator multi-factor authentication, encryption, secure backups and tested recovery.

• Restrict safeguarding and school-passenger records. Log sensitive access and changes; define retention, deletion and legal-hold procedures by record type.

• Provide the data-processing agreement, hosting locations, subprocessor list, security incident process and assistance with data-rights requests.

• Customer tracking links must be hard to guess, access-controlled as appropriate, time-limited and revoked when no longer required.

• Assess privacy risks before tracking drivers or processing sensitive school-passenger information; document lawful bases and necessary safeguards. ICO identifies geolocation tracking combined with other risk criteria as requiring a DPIA. [6]

Accessibility

Require accessible booking journeys and test keyboard use, labels, contrast and mobile readability. DfT best-practice guidance recommends that licensing authorities require digital booking platforms to meet at least WCAG 2.1 AA. [7]

06 / Integrations and service terms

Specify costs, dependencies, ownership and a workable exit

11. Integrations and reporting

• Quote separately for website bookers, branded links, telephone caller identification/history lookup, SMS, email and official WhatsApp Business messaging.

• Identify map/routing, flight-data, payment, accounting, vehicle tracking and fleet-maintenance providers. State API charges, limits and failure handling.

• Provide documented APIs, authentication, integration support and exports. External outages must appear in the controller interface.

• Report revenue, unpaid invoices, driver balances, profitability, punctuality, cancellations, booking sources and school-contract performance by company and date. State how each metric is calculated.

12. Reliability, migration, ownership and exit

• Contractually agree uptime, support coverage, critical-incident response times, escalation and planned maintenance notifications.

• Agree recovery-time and recovery-point targets; demonstrate backup restoration and a usable outage contingency for live and upcoming jobs.

• Migrate customers, accounts, drivers, vehicles and agreed booking history through a sample import, reconciliation, acceptance and rollback plan. Confirm access rights to source-system exports.

• DEC retains ownership of its business data. Specify complete export formats, attachments, audit trails, retrieval times and exit-assistance charges.

• Define control of telephone numbers, domains, app-store accounts, payment accounts and integration credentials.

• For a custom build, agree source-code rights, repository access, deployment documentation, hosting handover, defect warranty and ongoing maintenance responsibilities.

Three-year cost schedule required

Cost category	Supplier must disclose
Setup	Configuration, migration, training, branding and integrations.
Recurring	Driver licences, controller seats, sub-companies, apps, hosting and support.
Usage	Messages, calls, maps, flight data, payments and API usage.
Changes and exit	Development rates, upgrades, cancellation, export and transition support.

State assumptions, minimum commitment, price increases, VAT, fair-use limits and which third-party accounts DEC must hold directly.

07 / Acceptance and references

Require evidence before final payment and launch

Mandatory supplier acceptance demonstrations

• 1. A delayed airport arrival clashes with an assigned school run: show the alert, availability recheck and safe reassignment.

• 2. An expired driver licence or invalid vehicle insurance blocks allocation; renewal evidence restores eligibility only after authorised review.

• 3. A school route needs a replacement driver and two PAs: show suitability checks, notifications, attendance and handover.

• 4. A paid return booking is amended: preserve payment history, show the revised price and prevent duplicate charging.

• 5. A sub-company controller cannot view another company's restricted records; DEC head office sees authorised group reports.

• 6. Export a complete booking with its changes, invoice, payment references and audit trail in usable formats.

• 7. Simulate driver data loss and a system outage; show stale-location warnings, recovery, backup restoration evidence and contingency procedures.

Delivery and sign-off

Agree a requirement-by-requirement response, demonstration results, implementation milestones, tariff approval, migration reconciliation, staff training and a controlled pilot. Define defects that block launch and the process for resolving them. Keep dispatch, airport scheduling, school transport, compliance and accounts as acceptance conditions.

App references and recommendations

Part D | Combined specification v1.4 - Public copy | 28 October 2026

Review scope and recommendation

Reviewed all four supplied Apple app identities, public listing descriptions, release information and published screenshots. Official supplier product pages were also reviewed. No signed-in app, live dispatch backend or real journey was tested. Screenshots illustrate published interfaces and may lag current releases. The recommendations below describe what DEC should require, rather than certifying a best-performing supplier.

App reference	Verified role and recommended use
R1 - iCabbi Driver App ID 718845727	Driver app. Listing confirms job handling; official Drive page advertises bid maps, navigation, messaging, earnings, safety and scheduling features. Recommended reference for a clear driver home screen and advanced dispatch tools. [R1, R5]
R2 - Blacklane - Book Private Rides ID 524123600	Customer booking app, not the driver app. Useful for airport/chauffeur booking, guest passengers, vehicle selection, flight-linked collection, tracking and payment presentation. Do not infer driver-office functions from it. [R2]
R3 - Autocab Driver Companion ID 1290768019	Driver app linked to its operator dispatch system. Listing describes jobs, GPS navigation, payments, office messages, pricing and preassigned work. Official site also advertises document uploads, bidding and destination mode. Useful for prebooking and staff-document workflows. [R3, R6]
R4 - CabTreasure Driver ID 1627740842	Driver app requiring its operator system and activation. Listing describes chat, job history, queue/follow-on work, future jobs, fares and card-provider integration. Useful reference for everyday dispatch queues and job handling. [R4]

Best combination for DEC - advisory conclusion

Use iCabbi for driver usability and advanced allocation ideas; Autocab for future-work planning and document submission; CabTreasure for the daily job/queue workflow; and Blacklane for the customer airport/chauffeur journey. Keep DEC fleet checks, garage actions, PA records and school safeguards as explicit additional modules. The reviewed material does not establish that any one app delivers the whole combined specification.

Evidence and version boundaries

Official marketing describes the supplier platform, not necessarily the exact linked app version or DEC package. Autocab also publishes Driver Companion+ beta release notes; its offline and mid-trip payment features must not be attributed automatically to the supplied legacy iOS listing. Ask for the actual production app/version and subscription used in each demonstration. [R7]

Recommended core driver modules

REF-M01 to REF-M08 | Additive detail; existing mandatory requirements remain in scope

Module	DEC requirement and acceptance focus
REF-M01 - Driver home and job offer	Current duty/vehicle, current job, next commitment and earnings. Job offer shows pickup, scheduled time, vehicle/accessibility needs, expected travel and price/payment basis where authorised. Large readable controls, clear text and day/night mode. Test with real drivers on agreed phone sizes. References: iCabbi, Autocab.
REF-M02 - Job states	Accept > En route > Arrived > POB > Job Clear, with timestamps and immediate online office updates. Separate no-show/cancel/reassign flows. Completion does not imply payment. Require school sweep before availability, and retain all existing eligibility gates. Reference: CabTreasure workflow; exact labels are DEC requirements.
REF-M03 - Live map and navigation	On-duty map, pickup pin and written instructions, destination, ETA, traffic-aware routing where provided and saved navigation preference. Show GPS accuracy/freshness and offline state. Test locked-screen/background use and local airport entrances; never assume maps permit restricted roads. References: iCabbi and Autocab navigation; Cab Treasure product page.
REF-M04 - Future jobs and allocation	Today/upcoming/assigned/available/history views, follow-on jobs, configurable fair zones/queues and protected school commitments. Estimate end time plus travel/buffer before offering another job. Detect conflicts after job/flight changes. References: Autocab prebookings, iCabbi scheduling, CabTreasure queues.
REF-M05 - Communication and safety	Office chat, approved quick messages, configurable arrival notices and privacy-protecting passenger contact where supported. Show queued/sent/failed states; do not rely solely on push for emergencies. Panic/escalation has an office response owner. Controls and text-to-speech must minimise distraction; normal interactions are completed while safely stopped. Reference: iCabbi/CabTreasure.
REF-M06 - Fares and payments	Fixed and tariff pricing, waiting/extras, deposits, cash/card/account and PayPal as agreed. Explicit pending/success/failure, receipts, refunds and no duplicate charges. Earnings reconcile with commission, rent and cash. In-person contactless is subject to device, provider and contract support. References: all three driver apps; Blacklane customer payment flow.
REF-M07 - Airport/chauffeur work	Flight and terminal details, meet-and-greet/nameboard, buffer after landing, waiting allowance and extras, luggage suitability, hourly/day service and linked returns. Recheck availability after a flight delay; customer sees inclusions before confirming. References: Blacklane; Cab Treasure flight-tracker marketing requires demonstration.
REF-M08 - Compliance, fleet and PA	Driver documents/uploads feed verified records, not automatic clearance. Retain offline checks, fuel/charge/AdBlue, minor-defect garage actions, verified release and dedicated PA profiles/role-based access. Protected vetting stays separate. Reference: Autocab uploads; full fleet/PA detail is DEC-specific baseline.

The core table specifies proposed implementation detail and reference inspiration. Existing baseline obligations, including the customer app, school transport, finance and two years of free 24/7 backend support, remain mandatory. References do not grant integration rights or supplier accreditation.

Enhancements and quality gates

REF-E01 to REF-E05 and AT-R01 to AT-R08 | Delivery order does not remove baseline scope

Enhancements to quote separately where newly introduced

Enhancement	Recommendation and controls
REF-E01 - Bidding / busy-zone map	Operator-controlled bids, eligibility and fairness rules. School commitments cannot be displaced. Show indicative demand honestly; no guarantee of earnings. References: iCabbi, Autocab, Cab Treasure.
REF-E02 - Destination mode	Offer suitable jobs towards a selected end-of-shift destination, subject to existing jobs, duty limits and fleet rules. References: iCabbi and Autocab.
REF-E03 - In-car display	Apple CarPlay / Android Auto where supported; demonstrate device/platform approval and exactly which controls are available. iCabbi advertises support; it is not assumed for every app.
REF-E04 - Contactless / split payments	Phone-based contactless or mid-journey payments only via approved supported providers. Define settlement, refunds, balance and reconciliation. Autocab beta features require production-version verification.
REF-E05 - Passenger location sharing	Optional temporary passenger pin/live sharing with informed choice and a non-sharing alternative. Revoke after the job; retain strict school-passenger privacy. Reference: iCabbi product page.

Quality acceptance: prove behaviour, not just screen similarity

• AT-R01: Demonstrate the full status sequence on iPhone and Android with matching office states; wrong taps and unpaid completion remain recoverable and auditable.

• AT-R02: Test notification permissions, locked screens, background location, poor signal, battery saving and reconnect; last-known location must not appear live.

• AT-R03: Preserve queued job/check/message events once, with original and receipt times; no lost photos, duplicate invoices or repeated charges.

• AT-R04: Edit a prebooking and delay an airport flight; show driver acknowledgement, conflict detection and safe replacement while preserving school cover.

• AT-R05: Driver retains navigation preference, large text/day-night settings and current job after restart; errors have a clear recovery path.

• AT-R06: Validate fare/extras/waiting and cash/card/account reconciliation; show external payment failure and recovery without charging twice.

• AT-R07: Show no cross-driver earnings or documents after shared-device logout; map, APIs, exports and links enforce company/role separation.

• AT-R08: Pilot representative duties/devices with nominated drivers and PAs, agree performance/recovery metrics, record defects and block launch for critical safety/access/data-loss failures.

Public review comments raise historical usability and stability issues such as notification handling, maps, settings and crashes. Treat these as test ideas, not verified current faults or a fair product ranking. [R1, R3, R4]

Required developer response - REF-DEL-01

Map REF-M01 to REF-M08, REF-E01 to REF-E05 and AT-R01 to AT-R08 to your proposed implementation and existing requirement IDs. State production app/OS/version, demonstrated functions, dependencies, limitations, configuration, one-off/recurring fees and acceptance evidence. Build original code, branding and layouts; these are functional references. Do not assume access to competitors' code, APIs or customer data.

Priority recommendation

First deliver a reliable driver app, live office map, job states, future bookings, payments and fleet/PA clearance integration. Validate airport/school conflicts, poor connectivity and real device behaviour before launch. Add newly proposed bidding, destination mode and in-car display features through agreed milestones. Existing mandatory scope remains intact.

Developer enquiries: submit all questions and quotations only through the platform where this requirement is published. No direct company contact details are supplied. The existing 24-month free 24/7 backend-support requirement remains in force.
